

# Introduction to the Course

TIME SERIES ANALYSIS IN PYTHON

**Rob Reider**

Adjunct Professor, NYU-Courant  
Consultant, Quantopian

# Example of Time Series: Google Trends

# Example of Time Series: Climate Data

# Example of Time Series: Quarterly Earnings Data

# Example of Multiple Series: Natural Gas and Heating Oil

# Goals of Course

- Learn about time series models
- Fit data to a time series model
- Use the models to make forecasts of the future
- Learn how to use the relevant statistical packages in Python
- Provide concrete examples of how these models are used

# Some Useful Pandas Tools

- Changing an index to datetime

```
df.index = pd.to_datetime(df.index)
```

- Plotting data

```
df.plot()
```

- Slicing data

```
df[ '2012' ]
```

# Some Useful Pandas Tools

- Join two DataFrames

```
df1.join(df2)
```

- Resample data (e.g. from daily to weekly)

```
df = df.resample(rule='W').last()
```

# More pandas Functions

- Computing percent changes and differences of a time series

```
df['col'].pct_change()  
df['col'].diff()
```

- pandas correlation method of Series

```
df['ABC'].corr(df['XYZ'])
```

- pandas autocorrelation

```
df['ABC'].autocorr()
```

# Let's practice!

TIME SERIES ANALYSIS IN PYTHON

# Correlation of Two Time Series

TIME SERIES ANALYSIS IN PYTHON

**Rob Reider**

Adjunct Professor, NYU-Courant  
Consultant, Quantopian

# Correlation of Two Time Series

- Plot of S&P500 and JPMorgan stock

# Correlation of Two Time Series

- Scatter plot of S&P500 and JP Morgan returns

# More Scatter Plots

- Correlation = 0.9

- Correlation = 0.4

- Correlation = -0.9

- Correlation = 1.0

# Common Mistake: Correlation of Two Trending Series

- Dow Jones Industrial Average and UFO Sightings ([www.nuforc.org](http://www.nuforc.org))

- Correlation of levels: 0.94
- Correlation of percent changes:  $\approx 0$

# Example: Correlation of Large Cap and Small Cap Stocks

- Start with stock prices of SPX (large cap) and R2000 (small cap)
- First step: Compute percentage changes of both series

```
df['SPX_Ret'] = df['SPX_Prices'].pct_change()  
df['R2000_Ret'] = df['R2000_Prices'].pct_change()
```

# Example: Correlation of Large Cap and Small Cap Stocks

- Visualize correlation with scatter plot

```
plt.scatter(df['SPX_Return'], df['R2000_Return'])  
plt.show()
```

# Example: Correlation of Large Cap and Small Cap Stocks

- Use pandas correlation method for Series

```
correlation = df['SPX_Ret'].corr(df['R2000_Ret'])  
print("Correlation is: ", correlation)
```

```
Correlation is: 0.868
```

# Let's practice!

TIME SERIES ANALYSIS IN PYTHON

# Simple Linear Regressions

TIME SERIES ANALYSIS IN PYTHON

**Rob Reider**

Adjunct Professor, NYU-Courant  
Consultant, Quantopian

# What is a Regression?

- Simple linear regression:

$$y_t = \alpha + \beta x_t + \epsilon_t$$

# What is a Regression?

- Ordinary Least Squares (OLS)

# Python Packages to Perform Regressions

- In statsmodels:

```
import statsmodels.api as sm  
sm.OLS(y, x).fit()
```

Warning: the order of **x** and **y** is not consistent across packages

- In numpy:

```
np.polyfit(x, y, deg=1)
```

- In pandas:

```
pd.ols(y, x)
```

- In scipy:

```
from scipy import stats  
stats.linregress(x, y)
```

# Example: Regression of Small Cap Returns on Large Cap

- Import the statsmodels module

```
import statsmodels.api as sm
```

- As before, compute percentage changes in both series

```
df['SPX_Ret'] = df['SPX_Prices'].pct_change()  
df['R2000_Ret'] = df['R2000_Prices'].pct_change()
```

- Add a constant to the DataFrame for the regression intercept

```
df = sm.add_constant(df)
```

# Regression Example (continued)

- Notice that the first row of returns is NaN

	SPX_Price	R2000_Price	SPX_Ret	R2000_Ret
Date				
2012-11-01	1427.589966	827.849976	NaN	NaN
2012-11-02	1414.199951	814.369995	-0.009379	-0.016283

- Delete the row of NaN

```
df = df.dropna()
```

- Run the regression

```
results = sm.OLS(df['R2000_Ret'], df[['const', 'SPX_Ret']]).fit()  
print(results.summary())
```

# Regression Example (continued)

- Regression output

```
=====
                        OLS Regression Results
=====
Dep. Variable:          R2000_Ret      R-squared:                0.753
Model:                  OLS           Adj. R-squared:           0.753
Method:                 Least Squares  F-statistic:              3829.

```

# Relationship Between R-Squared and Correlation

- $[\text{corr}(x, y)]^2 = R^2$  (or R-squared)
- $\text{sign}(\text{corr}) = \text{sign}(\text{regression slope})$
- In last example:
  - R-Squared = 0.753
  - Slope is positive
  - correlation =  $+\sqrt{0.753} = 0.868$

# Let's practice!

TIME SERIES ANALYSIS IN PYTHON

# Autocorrelation

TIME SERIES ANALYSIS IN PYTHON

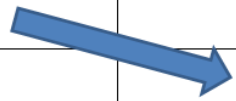

**Rob Reider**

Adjunct Professor, NYU-Courant  
Consultant, Quantopian

# What is Autocorrelation?

- Correlation of a time series with a lagged copy of itself

Series	Lagged Series
5	
10	5
15	10
20	15
25	20
⋮	⋮

- Also called **serial correlation**
- Lag-one autocorrelation

# Interpretation of Autocorrelation

- Mean Reversion - Negative autocorrelation

# Interpretation of Autocorrelation

- Momentum, or Trend Following - Positive autocorrelation

# Traders Use Autocorrelation to Make Money

- Individual stocks
  - Historically have negative autocorrelation
  - Measured over short horizons (days)
  - Trading strategy: Buy losers and sell winners
- Commodities and currencies
  - Historically have positive autocorrelation
  - Measured over longer horizons (months)
  - Trading strategy: Buy winners and sell losers

# Example of Positive Autocorrelation: Exchange Rates

- Use daily ¥/\$ exchange rates in DataFrame `df` from [FRED](#)
- Convert index to datetime

```
# Convert index to datetime
df.index = pd.to_datetime(df.index)
# Downsample from daily to monthly data
df = df.resample(rule='M').last()
# Compute returns from prices
df['Return'] = df['Price'].pct_change()
# Compute autocorrelation
autocorrelation = df['Return'].autocorr()
print("The autocorrelation is: ", autocorrelation)
```

```
The autocorrelation is: 0.0567
```

# Let's practice!
